Re Item III

Non-establishment of opinion with regard to novelty, inventive step and industrial applicability

- 1. The method claimed in claims 1-8 is purely mathematical in character and thus relates to matter not requiring international preliminary examination under Rule 67.1(i) PCT (see PCT Guidelines IV-2.4(a)).
- 2. Although claim 1 now defines a "method for authentication of a string of input characters", authentication is in itself merely a mathematical problem. It only becomes technical when embedded in a real system, eg when the method is for authentication of a string of input characters transmitted from a sender to a receiver (cf decision T 208/84 (VICOM) of the Technical Board of Appeal of the European Patent Office, in particular point 5 of the reasons for the decision).
- 3. However, if the above objection had been overcome, or were to be overcome in a subsequent regional phase, it appears that the method of claim 1 would be novel and involve an inventive step over the prior art D1-D6 (Articles 33(1)-(3) PCT):

INTERNATIONAL PRELIMINARY EXAMINATION REPORT - SEPARATE

International application No. PCT/EP00/02617

EXAMINATION REPORT - SEPARATE SHEET

The essential features of the method according to the invention are that before encryption, the encryption function is modified under control of the input characters, and subsequently the input characters are encrypted by the modified function.

D1 discloses a modified function, but not under control of the input characters.

D2 discloses a modifying function as part of the encryption algorithm itself.

D3 discloses an r-round product cipher, whereby on each encryption round the key is changed, but not the encryption function.

D4 discloses a system in which an instruction command specifies the encryption function, but the encryption function is not chosen based on the input characters to be encrypted.

In D5, the encryption function is modified based on a key, but not on the input characters to be encrypted.

In D6, a key is modified based on the input characters, but the function is unchanged.

Although various combinations of documents could theoretically produce the invention, combining encryption functions is considered to be artificial and to involve an excessive use of hindsight given the large number of possible combinations and the lack of obvious compatibility between different algorithms.

Re Item VIII

Certain observations on the international application

 Claim 1 is not clear and does not define all the essential features of the invention, as although claim 1 claims a method for authentication, only an algorithm is defined, without any features being defined which would indicate how this algorithm is embedded in a method for authentication, eg there is no mention of the transmitted and received message (Article 6 PCT).

Applicant

KONINKLIJKE KPN N.V.

International application No.

PCT/EP00/02617

- 1. The applicant is hereby notified that this International Preliminary Examining Authority transmits herewith the international preliminary examination report and its annexes, if any, established on the international application.
- 2. A copy of the report and its annexes, if any, is being transmitted to the International Bureau for communication to all the elected Offices.
- 3. Where required by any of the elected Offices, the International Bureau will prepare an English translation of the report (but not of any annexes) and will transmit such translation to those Offices.

4. REMINDER

The applicant must enter the national phase before each elected Office by performing certain acts (filing translations and paying national fees) within 30 months from the priority date (or later in some Offices) (Article 39(1)) (see also the reminder sent by the International Bureau with Form PCT/IB/301).

Where a translation of the international application must be furnished to an elected Office, that translation must contain a translation of any annexes to the international preliminary examination report. It is the applicant's responsibility to prepare and furnish such translation directly to each elected Office concerned.

For further details on the applicable time limits and requirements of the elected Offices, see Volume II of the PCT Applicant's Guide.

Re Item III

Non-establishment of opinion with regard to novelty, inventive step and industrial applicability

- 1. The method claimed in claims 1-8 is purely mathematical in character and thus relates to matter not requiring international preliminary examination under Rule 67.1(i) PCT (see PCT Guidelines IV-2.4(a)).
- 2. Although claim 1 now defines a "method for authentication of a string of input characters", authentication is in itself merely a mathematical problem. It only becomes technical when embedded in a real system, eg when the method is for authentication of a string of input characters transmitted from a sender to a receiver (cf decision T 208/84 (VICOM) of the Technical Board of Appeal of the European Patent Office, in particular point 5 of the reasons for the decision).
- 3. However, if the above objection had been overcome, or were to be overcome in a subsequent regional phase, it appears that the method of claim 1 would be novel and involve an inventive step over the prior art D1-D6 (Articles 33(1)-(3) PCT):

INTERNATIONAL PRELIMINARY

International application No. PCT/EP00/02617

EXAMINATION REPORT - SEPARATE SHEET

The essential features of the method according to the invention are that before encryption, the encryption function is modified under control of the input characters, and subsequently the input characters are encrypted by the modified function.

D1 discloses a modified function, but not under control of the input characters.

D2 discloses a modifying function as part of the encryption algorithm itself.

D3 discloses an r-round product cipher, whereby on each encryption round the key is changed, but not the encryption function.

D4 discloses a system in which an instruction command specifies the encryption function, but the encryption function is not chosen based on the input characters to be encrypted.

In D5, the encryption function is modified based on a key, but not on the input characters to be encrypted.

In D6, a key is modified based on the input characters, but the function is unchanged.

Although various combinations of documents could theoretically produce the invention, combining encryption functions is considered to be artificial and to involve an excessive use of hindsight given the large number of possible combinations and the lack of obvious compatibility between different algorithms.

Re Item VIII

Certain observations on the international application

1. Claim 1 is not clear and does not define all the essential features of the invention, as although claim 1 claims a method for authentication, only an algorithm is defined, without any features being defined which would indicate how this algorithm is embedded in a method for authentication, eg there is no mention of the transmitted and received message (Article 6 PCT).

Method for authentication of a string of input characters

The invention relates to a method according to the preamble of claim 1.

A method of said type is disclosed in EP-A-0399587. With the known method, the function ("algorithm") applied for enciphering consists of a non-linear function formed by a substitution box ("S box") generated as a function of the key. The document provides no further description of the way in which the substitution box is generated. For obtaining good statistical properties of the output of the substitution box with respect to variable import, a string of characters obtained by applying the substitution box are combined with just as long a string of statistically well-distributed characters. The string of characters obtained in this connection may be used for enciphering a string of input characters to be enciphered in an enciphered string of output characters. By applying a key-dependent substitution box instead of a permanent substitution box, the enciphering function is reinforced.

An objection to the known method is that, when there is substantially always used the same key, said reinforcement of the enciphering function in practice is appreciably annihilated. Such may occur, e.g., upon authentication when using a chip card, such as a calling card and a GSM card.

The object of the invention is to exclude the drawbacks of the known method. To this end, the invention provides a method as described in claim 1.

The sender of the enciphered string of output characters and the receiver of said series must both dispose of the same key and the string of input characters used for enciphering, at any rate the portion of the latter series used for modifying the function. As a result, the method is particularly suited for authentication, the receiver of an enciphered string of characters being capable of checking whether a sender having an identity suggested to the receiver has utilised a corresponding key, and in the event of a positive outcome of said check, the identity of the sender is ensured to the receiver.

The string of characters used for modifying the function are particularly variable and are, e.g., a challenge number generated per session, any (different) number, or a variable attribute of the sender, such as a balance kept up to date on a chip card.

If the non-linear function used for enciphering were an invertible function, the receiver of the enciphered string of characters may carry

15.

20

25

30

35

out said check using the same function, the same key and the received string of characters as an input for the function. The result must be equal to the string of input characters used for enciphering.

Since the receiver may also carry out the check by executing the same operations as the ones carried out by the sender, the series received by the receiver having to be equal to the series generated by the receiver. In such case, it is not required that the function be an invertible function, as a result of which, in the event of the complexity remaining constant, there may be realised a stronger enciphering function which is more resistant against attacks.

The function applied to enciphering preferably is a non-linear function which may be formed by way of a substitution box or a cryptographic function, such as a function in which, depending on the input and the key, specific operations are carried out or not.

It is noted that EP0801477 discloses an encryption method in which an "internal state" is controlling an encryption function which, in each encryption round, modifies the encryption function. According to the present invention, the encryption function is modified only once, in an initial step, while always, after the initial modification, the same encryption function is used in every new encryption round. Contrary to that in the known method the encryption function is modified in every encryption round. Further, in the known method the encryption function is not modified on the basis of the input text. According to the present invetnion the input text forms an essential parameter in modifying the encryption function.

Next, it is noted that US4979832 discloses an enciphering method in which a pseudo-random input string is added to an encryption function. The pseudo-random string used in the encryption function also has to be available in the decryption process. In the known method the encryption function is dynamically (continuously) modified during the encryption processes. This is essential in the method according otherwise the system would be highly insecure. According to the present invention, however, there is only an initial modification of the encryption function, prior to the encryption process itself. Consequently, during the subsequent encryption process the encryption function is not changed any more. The known method is aimed at encryption/decryption. The method according to the invention is specifically designed for authentication and even can in practice not be used for encryption/decryption.

10

15

20

25

30

35

40

Further properties and advantages of the invention will become clear from the explanation following below of embodiments of the invention in conjunction with the enclosed drawings, in which:

FIG. 1 shows a diagram of a known enciphering function;

FIG. 2 shows a diagram of a first embodiment of the invention;

FIG. 3 shows a flow diagram for the operation of the embodiment according to FIG. 2; and

FIG. 4 shows a different embodiment of the invention.

By way of a block 1, FIG. 1 presents a known enciphering function (or encryption function). The enciphering function utilises one or more functions 2, also presented by blocks. Assuming a string of input characters IN 3 to be enciphered, the enciphering function using a secret key 4 determines an enciphered string of output characters EXIT 5. The known enciphering function DES [= Data Encryption Standard] operates according to said principle, eight non-linear functions being used which are formed by substitution boxes ("S boxes"). The invention is not limited, however, to the DES function; neither is it limited to using non-linear functions and substitution boxes for the functions.

FIG. 2 shows a diagram of an enciphering function 7 based on the enciphering function of FIG. 1 according to the invention. The functions are indicated by reference numeral 8. The functions 8 may be modified by applying an associated reference function 9 based on the string of input characters IN 3 or part thereof. The modification functions 9 need not be equal.

Below, the operation of the enciphering function of FIG. 2 will be explained with reference to the flow diagram of FIG. 3.

A modification function 9 modifies the function 8 based on a string of modification characters initially derived from the string of input characters IN 3 (block 11). Modifying the function 8 takes place in several steps, namely, the steps n=0 to n=Nmax inclusive, Nmax being permitted to be permanent or also depending on, e.g., the series IN 3. That is why, at the start of the modification of the function 8, a step counter is reset (block 12). Subsequently, the function 8 is modified, based on the value of n and the modification series (block 13). Then the number of steps counted is incremented by 1 (block 14). Subsequently, it is checked whether the function 8 has already been modified the maximum number of times (block 15). When this condition is met, the modification of the function 8 is terminated; otherwise the string of modification characters are

is terminated; otherwise the string of modification characters are modified (step 16) and the function 8 is modified once again based on the new value of n and the modified string of modification characters (step

15

20

13). In Box I following below, an example is given for the operation of the enciphering function 7 shown in FIG. 2.

TABLE I

9	3	5	1			1	2	6	5	4	7	3	0		

It is assumed that the set of characters comprises eight characters, shown in the Table with the numerals 0 to 7 inclusive. It is further assumed that the function 8 is formed by a substitution box. Said box may be realised by a rewritable memory having eight memory locations containing addresses or sequential numbers 1=0...7. The memory locations each comprise one of the characters, each character figuring only once in the memory locations. In Table I, the content of a memory location having address or sequential number i is indicated by y(i). Initially, the memory locations for i=0...7 contain the characters 3, 0, 5, 7, 6, 4, 1, 2, respectively. Said string of characters form an initial substitution box. A character of a string of characters to be enciphered is considered to be address or sequential number i, and is replaced by the character in the memory location having said address. According to the initial substitution box of Table I, e.g., 0 is therefore replaced by 3, 1 by 0, 2 by 5, ..., 7 by 2.

Before a string of characters to be enciphered are actually enciphered, according to the invention the initial substitution box is modified first. According to the example of Table I, modification takes place in ten steps (step n=0 to n=Nmax inclusive). The modification takes

10

15

25

00

place depending on the characters of the string of characters to be enciphered, at any rate of several characters thereof. In Table I, the characters to be enciphered which are used for the modification of the substitution box are the characters 5, 2 and 3 indicated at step n=0. Said characters are allotted to variables x(0), x(1) and x(2), respectively.

During the first step with n=0, the character y(n), i.e., the character 3 of memory location 0, is exchanged with the character y(x(0)), namely, character 4 of location x(0)=5. In Table I, for clarity's sake, the exchanged characters of the substitution box of eight characters are underlined for each of the ten steps n=0, ...9.

Subsequently, there is calculated an auxiliary variable h, which is equal to:

h=(x(0)+x(1)) modulo (the number of possible characters), or in the example h=(x(0)+x(1)) modulo 8.

Subsequently, the characters of the string of modification characters x(0), x(1) and x(2) are replaced as follows (":=" means "becomes", i.e., an allotment).

20 x(0) := x(1),x(1) := x(2), and x(2) := h.

For each step, modifying characters based on the step number and the characters of the string of modification characters are repeated a suitable number of times, in the example of Table I Nmax+1=10 times. At the end of said modification function, the initial substitution box:

3, 0, 5, 7, 6, 4, 1, 2
has been replaced by a final substitution box:
1, 2, 6, 5, 4, 7, 3, 0.

Subsequently, the characters of an input series to be enciphered may, according to the order of the characters in the eventual substitution box, be replaced for providing an output string of enciphered characters. As a result, in the example the string of input characters 5, 2, 3 are replaced by 7, 6, 5, respectively. Said string of output characters are used for possible further steps of the enciphering function.

FIG. 4 shows the diagram of an enciphering function 18 which differs from the enciphering function 5 of FIG. 2 in that the modification function 9 is replaced by a modification function 19. Just as the modification function 19 depends on a number

10

15

20

of characters IN 3 to be enciphered, but in addition on a number of characters of the key 4.

Table II offers an example of the operation of the modification function 19.

TABLE II

Step	Strin	g of	mod	ifica	ation		From step n=0,										
n		racte	ers	for i	n>0	•	exchange y(nmod8) and y(x(0))										
	x(0) x(1)	x(2)	×				i y(i)	0	0	2 5	3 7	4 6	5 4	6	7 2		
0	5	2	3	2	4				4	0	5	7	6	3	1	2	
1	2	3	2	4	7				4	5	Ω	7	6	3	1	2	
2	3	2	4	7	5				4	5	2	0	6	3	1	2	
3	2	4	7	5	5	_			4	5	Q	1	6	3	1	2	
4	4	7	5	5	6				4	5	0	7	6	3	1	2	
5	7	5	5	6	3				4	5	0	7	6	2	ì	3	
6	5	5	6	3	5				4	5	0	7	6	1	2	3	
7	5	6	3	5	2		.`		4	5	0	7	6	3	2	1	
8	. 6	3	5	2	3				2	5	0	7	6	3	4	1	
9	3	5	2	3	1				2.	7	0	5	6	3	4	1	

Table II differs from Table I only in that the string of modification characters x(0), x(1), x(2) are completed by x(3), x(4). The characters x(3) and x(4) are derived from the key 4. In the example of Table II, the initial string of modification characters is 5, 2, 3, 2, 4. According to Table II, the eventual substitution box is:

The string of input characters IN 3 having the characters 5, 2, 3 is replaced, according to said eventual substitution box, by the enciphered string of output characters EXIT 20 having the characters 3, 0, 5.

The characters of the initial substitution box may be sorted at random for as long as both the sender of a string of enciphered characters UIT 5 and the receiver of the string of enciphered characters use the same initial substitution box. If it is possible to always meet said condition, the enciphering function may be reinforced by using, as an initial substitution box, a substitution box used during a preceding enciphering process, e.g., the most recently used eventual substitution

15

box. If there is a danger that said condition is not always met, it may be provided that the receiver of the string of enciphered characters 5 recalls several of such preceding substitution boxes and uses an older one thereof if deciphering the series received leads to a negative check result.

Since, both during enciphering a string of characters and during deciphering thereof, the keys used must be equal and knowledge must be available on the string of enciphered characters IN 3, the receiver of the enciphered series may carry out exactly the same operation, i.e., enciphering, as the receiver has carried out, and compare the results to one another. In this event, a non-invertible function may be used for the function which, in the event of constant complexity, makes a stronger enciphering function possible.

The modification functions explained in conjunction with Tables I and II serve only as an example. For modifying the string of modification characters there may be applied, e.g., for each step, more than two and/or a different number of modulo additions, and the characters of the modification series may be rearranged in other ways instead of by way of simple shifting.

CLAIMS

5

20

25

30

35

- 1. Method for authentication of a string of input characters (3) by means of an enciphering function (2, 8) enabled for enciphering said string of input characters under control of a string of key characters (4), comprising the steps of:
 - modifying, by application of a modification function, under control of a string of modification characters, said enciphering function;
- enciphering, by application of an enciphering function, under control
 of said string of key characters (4), said string of input characters,
 CHARACTERISED in that
 - said modification function (9, 19) is applied initially, prior to said application of the enciphering function and
- said initially applied modification function modifies the enciphering
 function (8) under control of modification characters which are derived from said string of input characters (3).
 - 2. Method according to claim 1, characterised in that said modification characters are also derived from said string of key characters (4).
 - 3. Method according to claim 1 or 2, characterised in that the modification function (9, 19) comprises the replacement of a character of the string of modification characters, by a replacement character obtained by an addition of two or more characters of the string of modification characters modulo the number of possible different characters.
 - 4. Method according to any preceding claim, characterised in that the modification function (9, 19) comprises the modification of sequence numbers of two or more of the characters of the string of modification characters.
 - 5. Method according to any preceding claim, characterised in that, for the modification of the function, there is used as an initial function the function which was used earlier for determining an earlier string of output characters (5, 20).

AMENDED SHEET

- 6. Method according to any preceding claim, characterised in that the function is a substitution function.
- 7. Method according to any of the claims 1 to 5 inclusive, characterised in that the function is a non-invertible function.
- 8. Method according to any of the preceding claims, characterised in that the function comprises a substitution box containing replacement characters for the characters of the string of input characters, and the modification function containing the exchange, depending on the string of modification characters, of two or more characters of the substitution box.

Grace Casuga

These Notes are intended to give the basic instructions concerning the filing of amendments under article 19. The Notes are based on the requirements of the Patent Cooperation Treaty, the Regulations and the Administrative Instructions under that Treaty. In case of discrepancy between these Notes and those requirements, the latter are applicable. For more detailed information, see also the PCT Applicant's Guide, a publication of WIPO.

In these Notes, "Article", "Rule", and "Section" refer to the provisions of the PCT, the PCT Regulations and the PCT Administrative Instructions respectively.

INSTRUCTIONS CONCERNING AMENDMENTS UNDER ARTICLE 19

The applicant has, after having received the international search report, one opportunity to amend the claims of the international application. It should however be emphasized that, since all parts of the international application (claims, description and drawings) may be amended during the international preliminary examination procedure, there is usually no need to file amendments of the claims under Article 19 except where, e.g. the applicant wants the latter to be published for the purposes of provisional protection or has another reason for amending the claims before international politication. Furthermore, it should be emphasized that provisional protection is available in some States only.

What parts of the international application may be amended?

Under Article 19, only the claims may be amended.

During the international phase, the claims may also be amended (or further amended) under Article 34 before the International Preliminary Examining Authority. The description and drawings may only be amended under Article 34 before the International Examining Authority.

Upon entry into the national phase, all parts of the international application may be amended under Article 28 or, where applicable, Article 41.

When?

Within 2 months from the date of transmittal of the international search report or 16 months from the priority date, whichever time limit expires later. It should be noted, however, that the amendments will be considered as having been received on time if they are received by the International Bureau after the expiration of the applicable time limit but before the completion of the technical preparations for international publication (Rule 46.1).

Where not to file the amendments?

The amendments may only be filed with the International Bureau and not with the receiving Office or the International Searching Authority (Rule 46.2).

Where a demand for international preliminary examination has been is filed, see below.

How?

Either by cancelling one or more entire claims, by adding one or more new claims or by amending the text of one or more of the claims as filed.

A replacement sheet must be submitted for each sheet of the claims which, on account of an amendment or amendments, differs from the sheet originally filed.

All the claims appearing on a replacement sheet must be numbered in Arabic numerals. Where a claim is cancelled, no renumbering of the other claims is required. In all cases where claims are renumbered, they must be renumbered consecutively (Administrative Instructions, Section 205(b)).

The amendments must be made in the language in which the international application is to be published.

What documents must/may accompany the amendments?

Letter (Section 205(b)):

The amendments must be submitted with a letter.

The letter will not be published with the international application and the amended claims. It should not be confused with the "Statement under Article 19(1)" (see below, under "Statement under Article 19(1)").

The letter must be in English or French, at the choice of the applicant. However, if the language of the international application is English, the letter must be in English; if the language of the international application is French, the letter must be in French.

Notes to Form PCT/ISA/220 (first sheet) (January 1994)

NOTES TO FORM PCT/ISA/220 (continued)

The letter must indicate the differences between the claims as filed and the claims as amended. It must, in particular, indicate, in connection with each claim appearing in the international application (it being understood that identical indications concerning several claims may be grouped), whether

- (i) the claim is unchanged;
- (ii) the claim is cancelled;
- (iii) the claim is new;
- (iv) the claim replaces one or more claims as filed;
- (v) the claim is the result of the division of a claim as filed.

The following examples illustrate the manner in which amendments must be explained in the accompanying letter:

- [Where originally there were 48 claims and after amendment of some claims there are 51]: "Claims 1 to 29, 31, 32, 34, 35, 37 to 48 replaced by amended claims bearing the same numbers; claims 30, 33 and 36 unchanged; new claims 49 to 51 added."
- Where originally there were 15 claims and after amendment of all claims there are 11]:
- 3. [Where originally there were 14 claims and the amendments consist in cancelling some claims and in adding new claims]:
 "Claims 1 to 6 and 14 unchanged; claims 7 to 13 cancelled; new claims 15, 16 and 17 added." or "Claims 7 to 13 cancelled; new claims 15, 16 and 17 added; all other claims unchanged."
- [Where various kinds of amendments are made]:

 "Claims 1-10 unchanged; claims 11 to 13, 18 and 19 cancelled; claims 14, 15 and 16 replaced by amended claims 14; claim 17 subdivided into amended claims 15, 16 and 17; new claims 20 and 21 added."

"Statement under article 19(1)" (Rule 46.4)

The amendments may be accompanied by a statement explaining the amendments and indicating any impact that such amendments might have on the description and the drawings (which cannot be amended under Article 19(1)).

The statement will be published with the international application and the amended claims.

it must be in the language in which the international appplication is to be published.

It must be brief, not exceeding 500 words if in English or if translated into English.

It should not be confused with and does not replace the letter indicating the differences between the claims as filed and as amended. It must be filed on a separate sheet and must be identified as such by a heading, preferably by using the words "Statement under Article 19(1)."

It may not contain any disparaging comments on the international search report or the relevance of citations contained in that report. Reference to citations, relevant to a given claim, contained in the international search report may be made only in connection with an amendment of that claim.

Consequence if a demand for international preliminary examination has already been filed

If, at the time of filing any amendments under Article 19, a demand for international preliminary examination has already been submitted, the applicant must preferably, at the same time of filing the amendments with the International Bureau, also file a copy of such amendments with the International Preliminary Examining Authority (see Rule 62.2(a), first sentence).

Consequence with regard to translation of the international application for entry into the national phase

The applicant's attention is drawn to the fact that, where upon entry into the national phase, a translation of the claims as amended under Article 19 may have to be furnished to the designated/elected Offices, instead of, or in addition to, the translation of the claims as filed.

For further details on the requirements of each designated/elected Office, see Volume II of the PCT Applicant's Guide.

included in the request.

1. If, in any of the Boxes, the space is insufficient to furnish all the information: in such case, write "Continuation of Box No...." [indicate the number of the Box] and furnish the information in the same manner as required according to the captions of the Box in which the space was insufficient, in particular:

- (i) if more than two persons are involved as applicants and/or inventors and no "continuation sheet" is available: in such case, write "Continuation of Box No. III" and indicate for each additional person the same type of information as required in Box No. III. The country of the address indicated in this Box is the applicant's State (that is, country) of residence if no State of residence is indicated
- (ii) if. in Box No. II or in any of the sub-boxes of Box No. III, the indication "the States indicated in the Supplemental Box" is checked: in such case, write "Continuation of Box No. II" or "Continuation of Box No. III" or "Continuation of Boxes No. II and No. III" (as the case may be), indicate the name of the applicant(s) involved and, next to (each) such name, the State(s) (and/or, where applicable, ARIPO, Eurasian, European or OAPI patent) for the purposes of which the named person is applicant;
- (iii) if, in Box No. II or in any of the sub-boxes of Box No. III, the inventor or the inventor/applicant is not inventor for the purposes of all designated States or for the purposes of the United States of America: in such case, write "Continuation of Box No. II" or "Continuation of Box No. II" or inventor(s) and, next to (each) such name, the State(s) (and/or, where applicable, ARIPO, Eurasian, European or OAPI patent) for the purposes of which the named person is inventor;
- (iv) if. in addition to the agent(s) indicated in Box No. IV, there are further agents: in such case, write "Continuation of Box No. IV" and indicate for each further agent the same type of information as required in Box No. IV;
- (v) if, in Box No. V, the name of any State (or OAPI) is accompanied by the indication "patent of addition," or "certificate of addition," or "in Box No. V, the name of the United States of America is accompanied by an indication "continuation" or "continuation-in-part": in such case, write "Continuation of Box No. V" and the name of each State involved (or OAPI), and after the name of each such State (or OAPI), the number of the parent title or parent application and the date of grant of the parent title or filing
- (vi) if. in Box No. VI, there are more than three earlier applications whose priority is claimed: in such case, write "Continuation of Box No. VI" and indicate for each additional earlier application the same type of information as required in Box No. VI;
- (vii) if, in Box No. VI, the earlier application is an ARIPO application: in such case, write "Continuation of Box No. VI", specify the number of the item corresponding to that earlier application and indicate at least one country party to the Paris Convention for the Protection of Industrial Property or one Member of the World Trade Organization for which that earlier application was filed.
- 2. If, with regard to the precautionary designation statement contained in Box No. V. the applicant wishes to exclude any State(s) from the scope of that statement: in such case, write "Designation(s) excluded from precautionary designation statement" and indicate the name or two-letter code of each State so excluded.
- 3. If the applicant claims, in respect of any designated Office, the benefits of provisions of the national law concerning non-prejudicial disclosures or exceptions to lack of novelty: in such case, write "Statement concerning non-prejudicial disclosures or exceptions to lack of novelty" and furnish that statement below.
